

## MEDICATION INTERACTION GUIDE

Issue Date: January 2023

### IMPORTANT DRUG INTERACTIONS TO MONITOR

This guide provides information on significant medication interactions that require clinical attention.

#### BETA BLOCKERS AND ANTIDIABETICS

Patients taking atenolol (e.g., Tenormin) and diabetes medications like metformin should be monitored closely.

#### NSAID CONSIDERATIONS

Ibuprofen (such as Advil) should be used with caution in patients with hypertension, as it may decrease the effectiveness of antihypertensive medications.

#### SPECIAL CONSIDERATION FOR ASTHMA PATIENTS

Patients with asthma should avoid non-selective beta blockers. Albuterol (Proventil) remains the rescue medication of choice.

Reference patient case studies are available in the clinical database under identifiers P-003 and P-004.
